## We claim:

- 1. A computer-implemented method for analyzing survey data, comprising:
  - (a) selecting a subset of members from a population;
  - (b) obtaining survey responses from the members in said subset;
- (c) generating point estimates of at least one population parameter;
  - (d) generating confidence bounds for said point estimates;
- (e) conducting a trend analysis on the point estimates of said at least one population parameter; and
- (f) predicting future behavior of said population based on said trend analysis.
- 2. The method of claim 1, wherein said selecting step is performed using probability sampling techniques.
- The method of claim 2, wherein said probability sampling techniques include simple random sampling, systematic sampling, stratified sampling, cluster sampling, and multi-stage sampling.
- 4. The method of claim 1, wherein said population parameter is one of population mean and population variance.

5

- 5. The method of claim 1, further comprising: weighting the survey responses to assign greater importance to responses of preselected respondents.
- 6. The method of claim 1, wherein the trend analysis is a regression performed over a predetermined period of time.
- 7. The method of claim 1, wherein said point estimates are constrained by a predetermined amount.
